About me

Frontend Engineer specializing in Vue.js, Nuxt, and Tailwind CSS, with a background in industrial design and a strong eye for visual detail and user experience. Independently built the frontend of a course sales platform, led the upgrade from Vue 2 to Vue 3 and the migration from Webpack to Vite, and refactored code to make pages load about 3–5x faster. Recently, I've been building a personal homelab with Raspberry Pi and exploring workflow automation with n8n.

Work Experience

2022-03 ~ 2026-03

United Daily News Co., Ltd. Frontend Engineer

Owned frontend development for online course platforms: built 'U Haoxue (U 好學)' solo and led the frontend architecture of 'Yike Jingxuan (一刻鯨選)'.

- Sole frontend developer of 'U Haoxue (U 好學)', delivering course preview and checkout features with Nuxt.js; launched January 2026
- Led frontend architecture of 'Yike Jingxuan (一刻鯨選)', building e-commerce-like course sales functionality
- Encapsulated a video player plugin to enhance product extensibility
- Refactored and optimized code, cutting load times by roughly 3–5x
- Led the migration from Webpack to Vite and the upgrade from Vue 2 to Vue 3
- Integrated Tailwind CSS to enhance development efficiency and code maintainability

2021-09 ~ 2021-12

FlyingCrazyer Co., Ltd. Frontend Engineer

Rebuilt the 'Joberfly' website with Nuxt, modularizing components, introducing Tailwind CSS, and developing a new homepage and resume page.

- Refactored Joberfly website code and modularized components
- Introduced Tailwind CSS to build a new homepage
- Built a resume page with responsive design

2020-03 ~ 2021-08

JOY EDUCATION LTD. Web Designer

Built event webpages and a backend CMS, and contributed to several Vue.js projects; handled layout, animations, and UI/UX refinements, worked with the team on API integration, and used Git flow for version control.

- Created event webpages and wrote CMS
- Implemented frontend layout animations and UI/UX design optimization
- Collaborated on API integration and Git flow management

Side Projects

Dobby - LINE Bot

A LINE bot for one-tap badminton sign-ups in a group chat. As the organizer of a casual badminton group, I replaced our copy-paste text sign-up chain, which kept breaking on formatting mistakes. Dobby uses the Notion workspace I already used for bookkeeping as its database, so there was nothing new to set up.

#LINE Flex Message #Express.js #TypeScript #Notion API

The Most Annoying Cookie Banner

During a community hackathon, proposed a gamified design for the most annoying cookie banner, where players must find a ball hidden under moving cups and only allowing rejection of website cookies after successfully completing the game.

#Innovative gamified design #Participated in a hackathon

https://github.com/wen-hsiu-hsu/annoying-cookie-banner

Personal Blog

Built a personalized theme using VitePress, continuously updating programming notes and technical insights to document my learning progress.

#Continuous record of technical growth #Regular technical sharing
